Subject: Inquiry regarding the Functional Reality Transfer Pipeline (FRPT) framework

I am writing to share a theoretical framework that proposes a novel bridge between quantum information theory and geometrodynamics. In my recent work, I have derived the Einstein-Hilbert action and the Yang-Mills gauge action from a single discrete information-theoretic principle: the minimization of a global structural cost function (the Functional Reality Transfer Pipeline, or FRPT).

Key contributions of this framework include:

- * The derivation of the macroscopic Riemannian metric tensor via the spectral expansion of the Graph Laplacian.
- * The unification of gauge interactions as topological consistency protocols (holonomies) on the graph lattice.
- * An ab-initio topological approach to computing the proton-to-electron mass ratio and the fine-structure constant as geometric invariants of the vacuum network.

I have attached a full derivation document for your review, and I would be honored if you could provide your perspective on the mathematical validity of the mapping between the discrete heat kernel expansion and the emergent Einstein-Hilbert action.

Thank you for your time and for your pioneering work in this field.

Sincerely,

James Owen Morris
